Aim: To implement **Database Connectivity using JSP**

and Servlet.

CO Mapping – CO 2

Objective:

- . To implement a Donor Registration System using JSP and Servlet.
- To understand session management and the use of hidden fields.
- To validate and store user input and display a confirmation page.

Problem statement:
Design a **Donor Registration System** using JavaServer Pages (JSP) and servlet. Users have to register as blood donors by filling out a registration form and confirm their details before submitting the information. The application will involve registration, validation, and use of session management, and hidden fields to store user information.

Pages:

- register.jsp – Registration form to collect donor information.
- confirm.jsp – Displays filled data with hidden fields for confirmation.
- RegisterServlet.java – Servlet to process and validate data, save to session.
- Admin – give admin facilities add , view donor list via age group

Observation:

- User input was successfully collected using the register.jsp form.
- Data validation was performed in the servlet.
- Hidden fields were used to pass the validated data to the confirmation page.

Experiment No.6

Date:

Aim: Implementation of real world problem using servlets with database connectivity.

CO Mapping – CO 3

Objective:

1. To develop the servlet based application.
2. To use servlets as the primary component to process client requests and generate dynamic responses.
3. To integrate servlets with a relational database using JDBC to handle persistent data.
4. To ensure secure and efficient database operations, such as prepared statements to prevent SQL injection.

Lab Exercise:

Code:

Output:

Observation:
